UpFactor© is a company that aims to automate and industrialize the elevation process via a suite of software tools to detect and facilitate, thanks to smart data, the large-scale identification of real estate potential and of aerial land in particular.

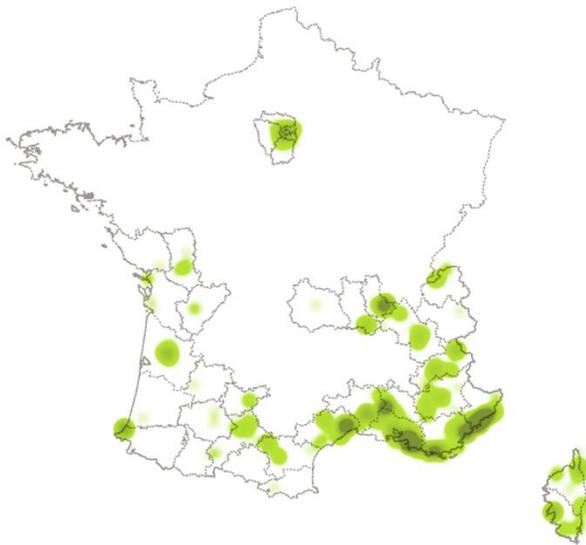

OUR GOAL?

- Develop unexploited territories to create new m²
- Help owners and co-owners measure the potential of their air assets
- Promote comprehensive renovation of existing buildings

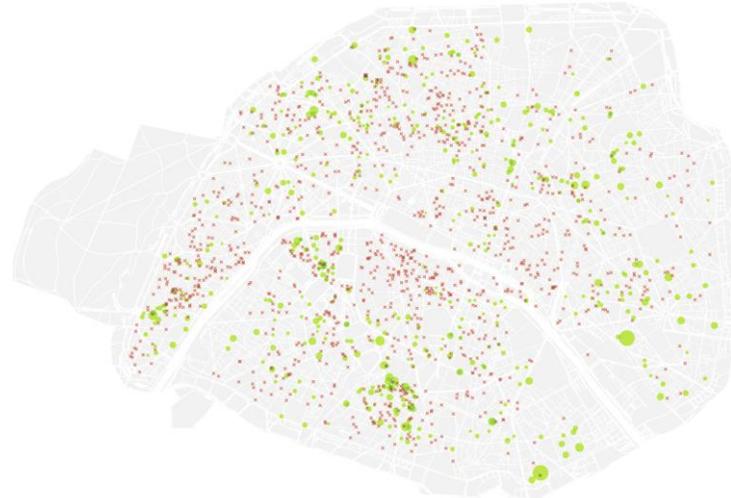

UPFACTOR GEOSERVICES[©]

LARGE-SCALE ELEVATION

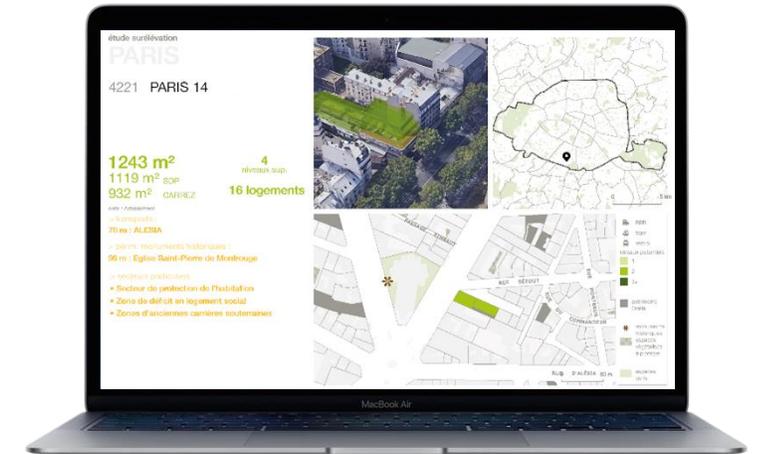

DETECTING OPPORTUNITIES

SELECTING POTENTIAL

MEASURING BUILDING AREA

UPFACTOR GEOSERVICES®

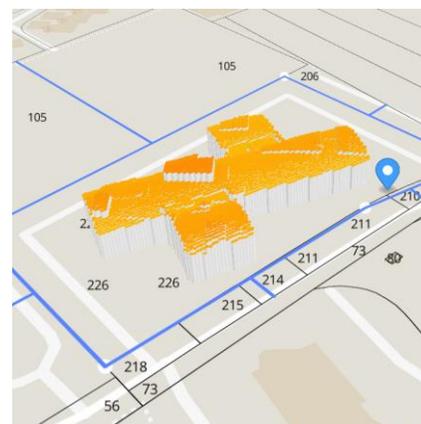

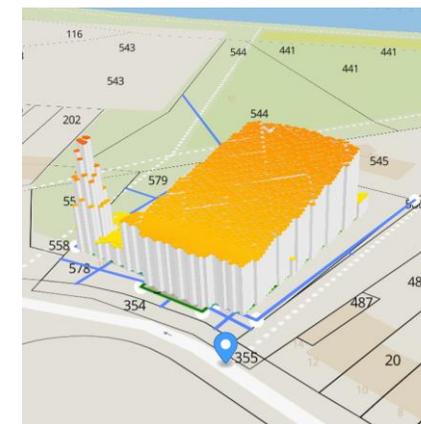

PROPTech FOR ELEVATION

The UPFACTOR GEOSERVICES® Geographic Information System can be used to assemble :

- built-up areas
- cadastral rights-of
- wayroad
- Network administrative
- Boundaries
- ground relief

to which are added height data, LIDAR or photogrammetry, processed internally by UPFACTOR to obtain the finest spatial description of the buildings studied.

A geo-referencing system is coupled to our tool, enabling immediate geolocation of our customers' address lists.

Examples of 3D visualizations in GEOSERVICES of some buildings in the Lille European Metropolis

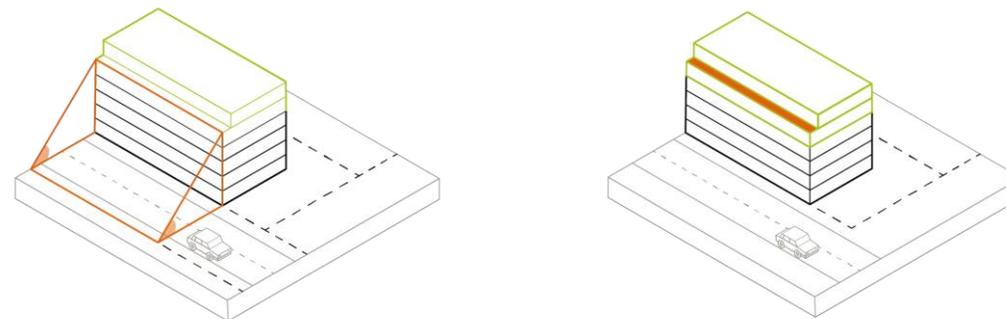

UPFACTOR GEOSERVICES®

PROPTech FOR ELEVATION

Our GIS also brings together all the regulatory data sets from the PLUs of the municipalities studied (zoning plans, height plans, specific sectors, protected buildings, etc.).

The PLU rules governing over-elevation (maximum heights and surface areas, siting and setbacks) are streamlined and integrated into our software, enabling us to estimate the over-elevation potential of each building with a single click, visualized in a web interface.

The GEOSERVICES® tool also determines the feasibility of over-elevations according to building morphology and location (historical monument perimeter, proximity to transport, etc.).

Example of a rule expressing a maximum facade height defined by the road and a fixed distance crowning setback (UPFACTOR)
